STUDY AREA

The protected area „Obrenovački zabran” (OZ) is located between the Sava and Kolubara Rivers in northwest Serbia (Fig. S-1). More precisely, with its extreme north-eastern border, OZ reaches the right bank of the Sava River, and in the south and east, it almost abuts the left bank of the Kolubara River. The OZ is located 1.5 km east of the city of Obrenovac and 12 km southwest of the suburbs of the city of Belgrade (the capital of Serbia). The total protected area is 47,77.18 ha. The whole location is specific by its hydrological, morphological, and geological characteristics. The protected area belongs to the plain terrain, i.e., the alluvial plains of the Sava and Kolubara Rivers above, which is a river terrace Lower Pliocene age, marly clay are dark gray to gray, and underlying river terrace sediments. Due to the meandering of the Sava and Kolubara Rivers during the Holocene, the formed terrace represents a common terrace for both Rivers. Five sediment samples (S1 – S5) and 7 soil samples (M1 – M7) were taken from the protected area OZ. The surface sediments and the soil were taken at a depth of 0 – 10 cm. The sediment samples were taken from the Sava River and soil samples were taken from the area that is flooded at high Kolubara River groundwater levels. The collected samples were immediately transferred into dark glass bottles and transported to the laboratory.
