## EXPERIMENTAL

Preparation of the reactant solutions for synthesis in continuous flow microreactor system
In the first set of experiments, the following solutions were made: acetylacetone $(0.06$ $\mathrm{mol}, 6.008 \mathrm{~g})$ and ethyl acetoacetate ( $0.06 \mathrm{~mol}, 7.808 \mathrm{~g}$ ) and added to volumetric flasks, sequentially, then methanol was added up to a volume of 100 mL . The solution of $N$-substituted cyanoacetamide was made in the same way. The corresponding $N$-substituted cyanoacetamide ( 0.06 mol ) was placed in a volumetric flask and deionized water was added up to a volume of 100 mL . Sodium hydroxide pellets $(0.07 \mathrm{~mol}, 2.8 \mathrm{~g})$ were dissolved in deionized water up to a volume of 100 mL .

In the second set of experiments, compounds $\mathbf{1}$ and $\mathbf{2}$ were synthesized from the solutions prepared using the following procedure: acetylacetone ( $0.10 \mathrm{~mol}, 10.013 \mathrm{~g}$ ) and ethyl acetoacetate $(0.10 \mathrm{~mol}, 13.014 \mathrm{~g})$ were placed in volumetric flasks, sequentially, and methanol was added up to a volume of 100 mL . Cyanoacetamide ( $0.15 \mathrm{~mol}, 12.612 \mathrm{~g}$ ) and NaOH pellets $(0.2 \mathrm{~mol}, 8 \mathrm{~g})$ were dissolved in deionized water in volumetric flasks up to a volume of 100 mL .
Work-up of the reaction mixture in the continuous flow microreactor system
The reaction mixture assembled in the microreactor was delivered to a test tube containing 1 mL of concentrated HCl . After 9 mL of the mixture was collected, resulting crystals were separated by filtration and washed with deionized water ( 2 times with 5 mL ). Obtained crystals were air dried and analyzed without further purification.

## Synthesis under conventional conditions

6- and 1,6-substituted 3-cyano-4-methyl-2-pyridones were prepared from corresponding 1,3-dicarbonyl reagent and N -substituted cyanoacetamides using a modified literature procedure. ${ }^{1}$

[^0]Procedure for the preparation of N-substituted 3-cyano-4,6-dimethyl-2-pyridone in the batch system

Equimolar amounts of acetylacetone and the corresponding N -substituted cyanoacetamide ( 0.06 mol ) were heated under reflux in a water/methanol mixture ( 120 mL ) in the presence of $\mathrm{NaOH}(0.07 \mathrm{~mol})$ as catalyst for 4 h , except for 3-cyano-4,6-dimethyl-2-pyridone where the reaction time was 1 h . The products were isolated by filtration and purified by crystallization from ethanol.
Procedure for the preparation of N -substituted 3-cyano-6-hydroxy-4-methyl-2-pyridone in the batch system

Equimolar amounts of ethyl acetoacetate and the corresponding $N$-substituted cyanoacetamide ( 0.06 mol ) were heated under reflux in a water/methanol mixture $(120 \mathrm{~mL})$ in the presence of $\mathrm{NaOH}(0.07 \mathrm{~mol})$ as a catalyst for 8 h . The products were isolated by filtration and dissolved in 100 mL of hot water. After cooling, the solution was acidified with concentrated HCl to precipitate the 2-pyridone. The final product was isolated by filtration, washed with deionized water and air-dried.
