TABLE S-I. General characteristic of RB 19 dye

Property	Dye
Commercial name	Remazol Brilliant Blue R
C. I. number	61200
Apparent color	Blue
Purity	≈50 %
Molecular weight	626 g mol ⁻¹
Molecular formula	C ₂₂ H ₁₆ N ₂ Na ₂ O ₁₁ S ₃
Chemical structure	
Maximum absorption wavelength	592 nm
Water solubility	10 g dm ⁻³

Fig-S-1. Scheme of irradiation system with a plug flow reactor.

Fig. S-2. Changes in the UV/Vis spectra during UV/S₂O₈²⁻ treatment of RB 19 dye. $c_0(\text{RB 19}) = 50 \text{ mg}\cdot\text{L}^{-1}$, initial S₂O₈²⁻ concentration: a) before treatment, and after treatment with: b) 0.05, c) 0.1, d) 0.2, e) 0.4 and f) 0.6 mmol·L⁻¹, flow rate = 7 mL·min⁻¹, pH 3.0±0.1, UV light intensity = 1950 μW·cm⁻², temperature = 25±0.5 °C.

Fig. S-3. COD changes before and after UV/S₂O₈²⁻ treatment. $c_0(\text{RB } 19) = 50 \text{ mg}\cdot\text{L}^{-1}$, $c_0(\text{S}_2\text{O}_8^{2-}) = 1 \text{ mmol}\cdot\text{L}^{-1}$, flow rate $1.5 \text{ mL}\cdot\text{min}^{-1}$, pH 3 ± 0.1 , UV light intensity $1950 \mu\text{W}\cdot\text{cm}^{-2}$, temperature $25\pm 0.5 \text{ }^\circ\text{C}$.

Fig. S-4. The influence of flow rate on RB 19 dye degradation (inset represents changes in k at different flow rates). $c_0(\text{RB } 19) = 50 \text{ mg}\cdot\text{L}^{-1}$, $c_0(\text{S}_2\text{O}_8^{2-}) = 0.1 \text{ mmol}\cdot\text{L}^{-1}$, native pH 3.8 ± 0.1 , UV light intensity = $1950 \mu\text{W}\cdot\text{cm}^{-2}$, temperature = $25\pm 0.5 \text{ }^\circ\text{C}$.

Fig. S-5. The influence of different initial RB 19 concentrations on its degradation (inset represents changes in *k* at different dye concentrations). $c_0(\text{S}_2\text{O}_8^{2-}) = 0.1 \text{ mmol}\cdot\text{L}^{-1}$, flow rate = $7 \text{ mL}\cdot\text{min}^{-1}$, pH native 3.8 ± 0.1 , UV light intensity = $1950 \mu\text{W}\cdot\text{cm}^{-2}$, temperature = $25 \pm 0.5 \text{ }^\circ\text{C}$.

Fig. S-6. Influence of different concentrations of carbonate and bicarbonate anions on the removal efficiency of RB 19. $c_0(\text{RB } 19) = 50 \text{ mg}\cdot\text{L}^{-1}$, $c_0(\text{S}_2\text{O}_8^{2-}) = 0.1 \text{ mmol}\cdot\text{L}^{-1}$, flow rate $7 \text{ mL}\cdot\text{min}^{-1}$, pH 8.0 ± 0.1 (for bicarbonate) 12 ± 0.1 (for carbonate), UV light intensity $1950 \mu\text{W}\cdot\text{cm}^{-2}$.

Fig. S-7. Influence of different concentrations of chloride anions on the removal efficiency of RB 19. $c_0(\text{RB } 19) = 50 \text{ mg}\cdot\text{L}^{-1}$, $c_0(\text{S}_2\text{O}_8^{2-}) = 0.1 \text{ mmol}\cdot\text{L}^{-1}$, flow rate $7 \text{ mL}\cdot\text{min}^{-1}$, pH native 3.8 ± 0.1 , UV light intensity $1950 \mu\text{W}\cdot\text{cm}^{-2}$.

Example of k calculation according to Eq. (4):

Experimental conditions:

- initial pH value 3.00 ± 0.1
- initial $\text{S}_2\text{O}_8^{2-}$ concentration = $0.1 \text{ mmol}\cdot\text{L}^{-1}$
- flow rate = $7 \text{ mL}\cdot\text{min}^{-1}$
- UV light intensity = $1950 \mu\text{W}\cdot\text{cm}^{-2}$
- $c_0(\text{RB } 19) = 50 \text{ mg}\cdot\text{L}^{-1}$ (before treatment)
- $c(\text{RB } 19) = 1.64 \text{ mg}\cdot\text{L}^{-1}$ (after treatment)
- $\tau = 22 \text{ min}$

$$\tau = \frac{1}{k} \ln \frac{c_0}{c}$$

$$k = 1/22 \text{ min} \cdot \ln 50/1.64 = 0.155 \text{ min}^{-1}$$
